

MDI Business Solutions Hosting Features

Statistics

The **Analog reporting tool** presents a comprehensive coverage of web server statistics available for your web site using CPanel. (See <http://www.analog.cx>).

You can **view statistics specifically for each subdomain** using the Analog and Webalizer tools.

This quick tool (**Latest Visitors**) lists the last 300 visitors that have visited your site in the last 24 hours. Note that visitors are defined as requests from servers, not individual people.

You can download the **raw access logs** that contain all the recorded hit information that your site has received. These logs are only really useful if you have a preferred reporting tool that you prefer to use, rather than the variety of reporting tools presented in this section.

The **Disk Usage Viewer** enables you to see exactly how much disk space is being taken up by various parts of your web site. Several different viewing options are available:

- **Show Parent Directories** - Displays the parent directories as individual items.
- **Show More Directory Depth** - Displays directories one level deeper as individual items.
- **Show Less Directory Depth** - Displays directories one level higher as individual items.
- **Show Top Level** - Displays the top level of the web site.
- **Clear File Usage Cache** - Deletes all file usage information from the cache and recalculates all disk usage information.
- **Show Small Files** - Displays very small files.
- **Show File Size as bytes/Megabytes** - Displays file sizes as bytes or megabytes. There are 1024 bytes to one megabyte.

Most of the above viewing options have a reverse option. For example, if **Show Small Files** is chosen, **Hide Small Files** is now displayed.

The **Bandwidth tool** generates an overall summary of the amount of bandwidth that your site is using. This is generated from HTTP traffic (looking at your web site, downloading files, etc.) and possibly FTP traffic. However, this does not include any other type of traffic, the most notable of which is POP3 - e-mail. Depending on what files you send and receive through e-mail, this amount could be considerable. Contact your hosting administrator if you want to check how much bandwidth you are using.

The **error log** contains all HTTP errors that occur when visitors attempt to view your site, such as requested files not found, etc. The Error Log tool is a presentation of the last 300 entries in your error log. A central use of this tool is to locate suspicious server activity, such as attempted virus attacks. Please contact your hosting administrator if you have concerns about activity in your error logs.
